PCE Inhalation & Health Effects

Former GM Moraine Site

- ❖ 89 indoor air samples were collected from 42 properties
- ❖ Of the 89 samples, 82 had detections of PCE

Occupational Safety and Health Administration (OSHA) Permissible Exposure Limits (PEL) = 100,000 ppb (based upon an 8 hr. work day -- industrial setting -- healthy adult)

Glossary of Terms:

- Units measured in parts per billion (ppb).
- Acute exposure = short-term
- Chronic exposure = long-term
- Cancer Risk = Theoretical number of increases in cancer risk if a person is exposed 365 days a year for 70 years
- RfC = daily exposure that is unlikely to cause an adverse health effect

EPA Theoretical Additional Lifetime Cancer Risk Calculations for Chronic PCE Inhalation Exposures
60.0 ppb = 1 in 10,000 risk 10^{-4}
6.0 ppb = 1 in 100,000 risk 10^{-5}
0.6 ppb = 1 in 1,000,000 risk 10^{-6}

1 ppb

Acute Human Effects:

100,000 - 200,000 ppb
(irritation eyes and
respiratory tract)

Chronic Human Effects:

50,000 -300,00 ppb
(dizziness, headache, lack
of coordination)

Human Odor Threshold
(where humans can smell
PCE) = 1000 ppb

U.S. EPA indoor air sampling
at GM Moraine highest PCE
value recorded in a home =
22.0 ppb

U.S. EPA's Chronic inhalation
Reference Concentration
(RfC) = 6.0 ppb

U.S. EPA indoor air sampling
at GM Moraine average PCE
value recorded in homes =
2.1 ppb
